

Prompt –

Write selenium test steps to verify the add to cart functionality on an e commerce website.

Model 1 – Amazon Nova Pro 1.0

Input Tokens – 16

Output Tokens – 1128

Latency – 8147 ms

Model 2 – Amazon Nova 2 Lite v1

Input Tokens – 112

Output Tokens – 2748

Latency – 13528 ms

Model 3 – Amazon Nova Micro 1.0

Input Tokens – 16

Output Tokens – 512

Latency – 1413 ms

Model 4 – Meta Llama 3 70B Instruct

Input Tokens – 30

Output Tokens – 512

Latency – 12510 ms

Observation - As output token count increases, latency generally increases. However, efficiency varies across models. Amazon Nova Pro provides a good compromise between response detail and execution time, while Nova Micro prioritizes speed. Nova 2 Lite prioritizes completeness at the cost of latency and Meta Llama 3 70B Instruct appears less latency-efficient for this specific Selenium test generation task.
